PRODUCT STRATEGY & USER EXPERIENCE DESIGN LEADER

Experience that makes products flow.

Connecting customer insight, product strategy, and DesignOps to empower teams to make better decisions and deliver products with greater clarity, speed, and confidence.

18+ years
Leadership experience in Design and Product

Multi-Industry
Experience across Product, SaaS, healthcare, and government sectors

Relevant Experience
Experience spanning small businesses through Fortune 3 enterprises

TOPIC 01 / AI-ENABLED INNOVATION

01 | Building capabilities after chasing novelty.

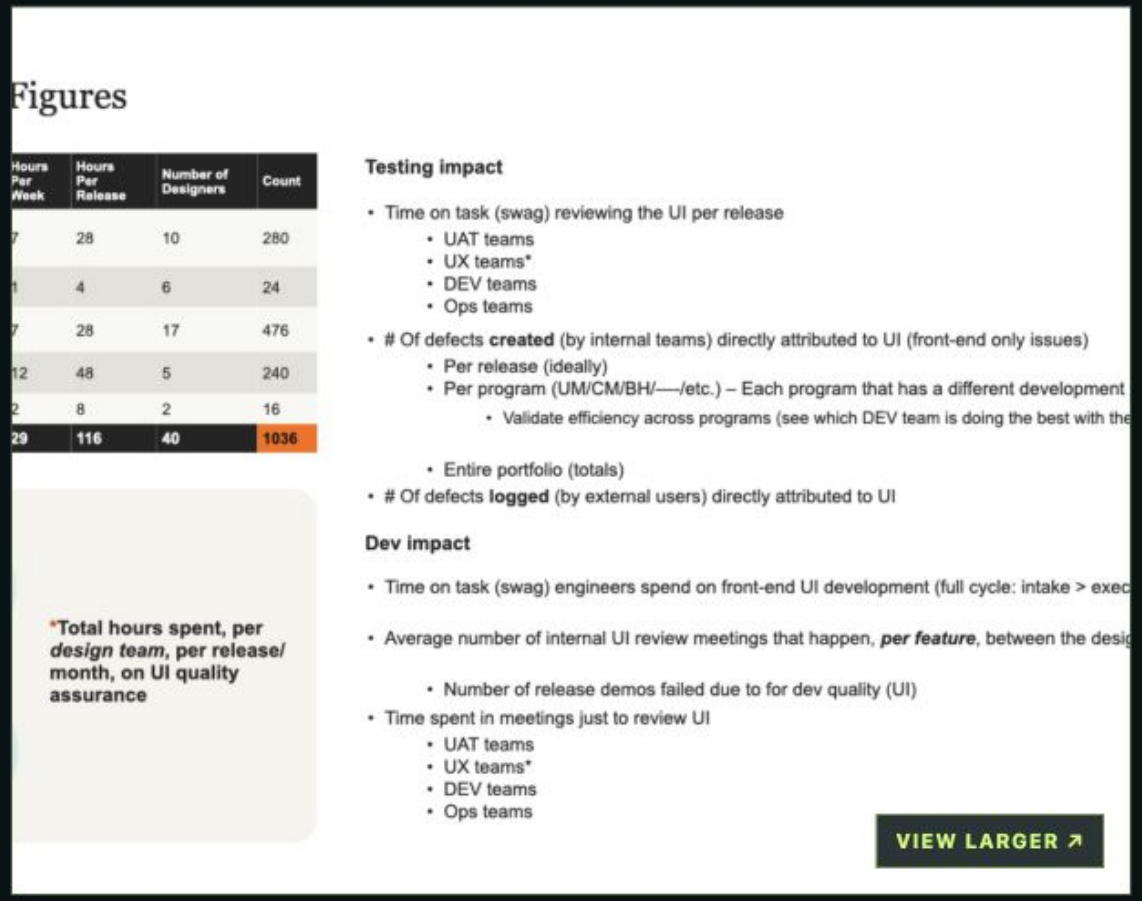

In 2023, while serving as the Director of UX for a Fortune 3 healthcare insurance company, there was an organization-wide AI initiative mandating usage of V0 (a generative AI design software created by Vercel). This controversial decision was met organizationally with negative feedback and a lack of adoption because it was made without design research and testing.

It was not until 2025, when I was able to gather enough organizational influence to challenge the organization's understanding of not only the limits of AI design, but also how AI can effectively be used in the product and design space today. I treated AI adoption as an operating-model challenge: define the outcome, evaluate fit, establish guardrails, equip teams, and measure where automation reduces production time and rework.

01.1

REDEFINING SCOPE

Reframing the mandate

This was an organization-wide mandate, so the most difficult part of t change was demonstrating the value of UX and design to parts of the organization with limited design maturity.

I reframed the problem by identifying the genuine UX gaps in the current development lifecycle. I built the case with data, real-time feedback, and industry best practices for product adoption and change management—not opinions.

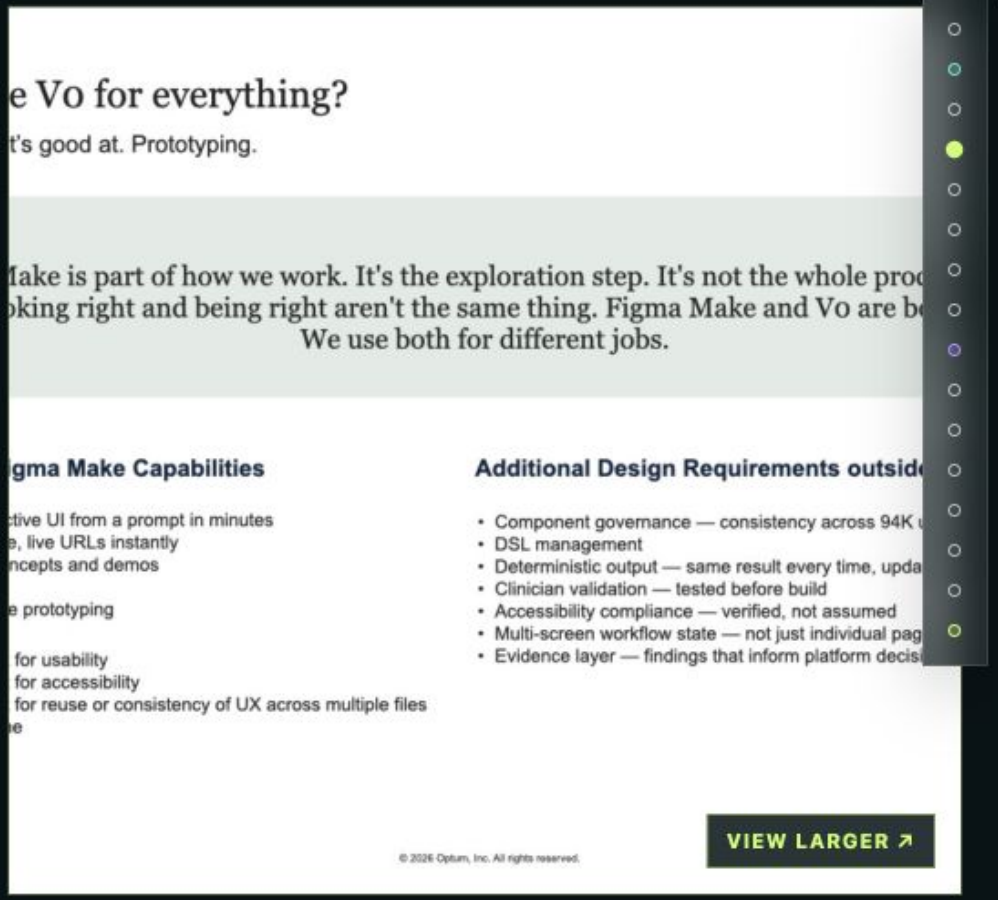

01.2

ROLE / LEADERSHIP

Strategy, feasibility, governance, and adoption

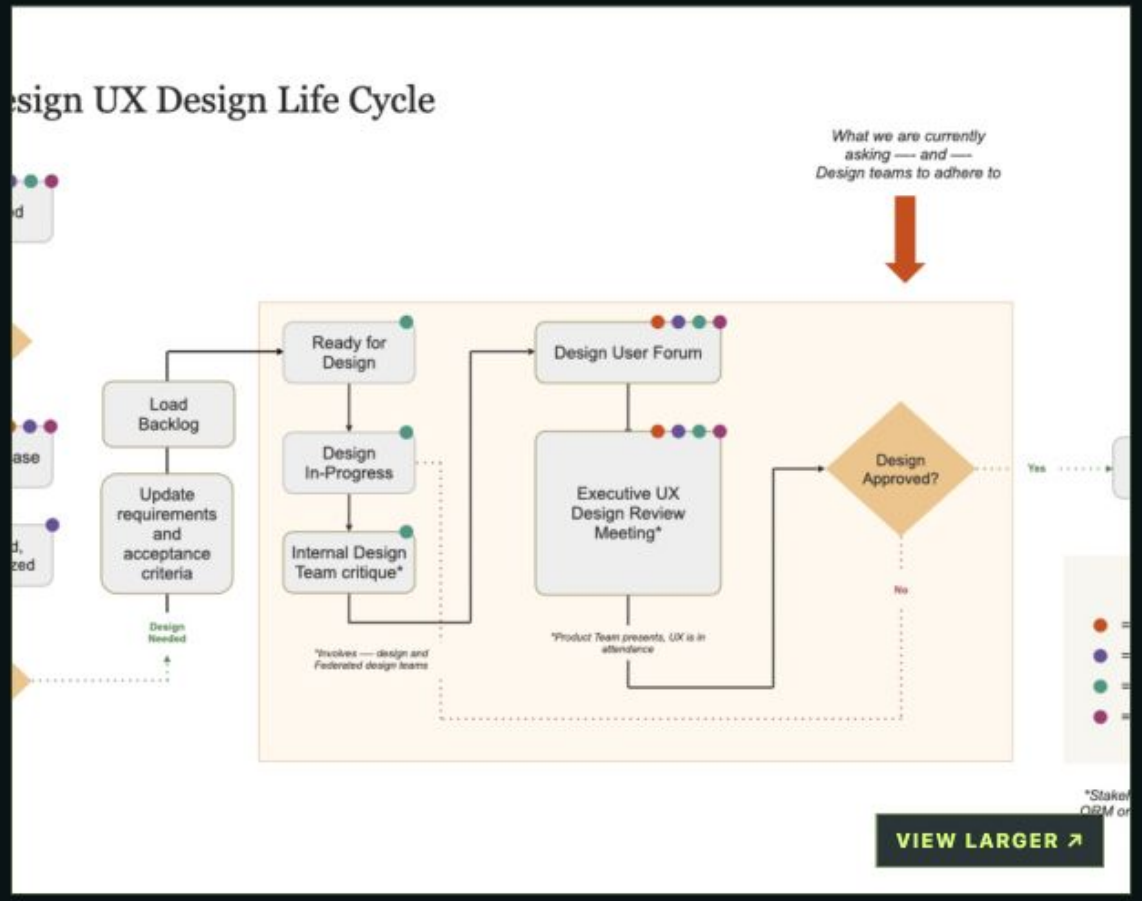

First, I helped leaders understand why the mandated solution would not work by presenting gap analyses, product-market-fit assessments, technology evaluations, and new ways to think about AI and design.

I also explained the capabilities and limits of generative AI, proposed updates to the product development lifecycle (PDLC), wrote and tested markdown guardrails, and supported adoption across the organization.

V0 capability and governance assessment

01.3

COLLABORATIVE PARTNERSHIPS

Shared ownership across Design, Product, and Engineering

To understand where AI UX solutions really applied in the product development lifecycle, product and engineering needed to understand the intricacies of design.

Once they understood how designs got made, they then could understand where AI could not replace a human designer's SME and where V0 had gaps.

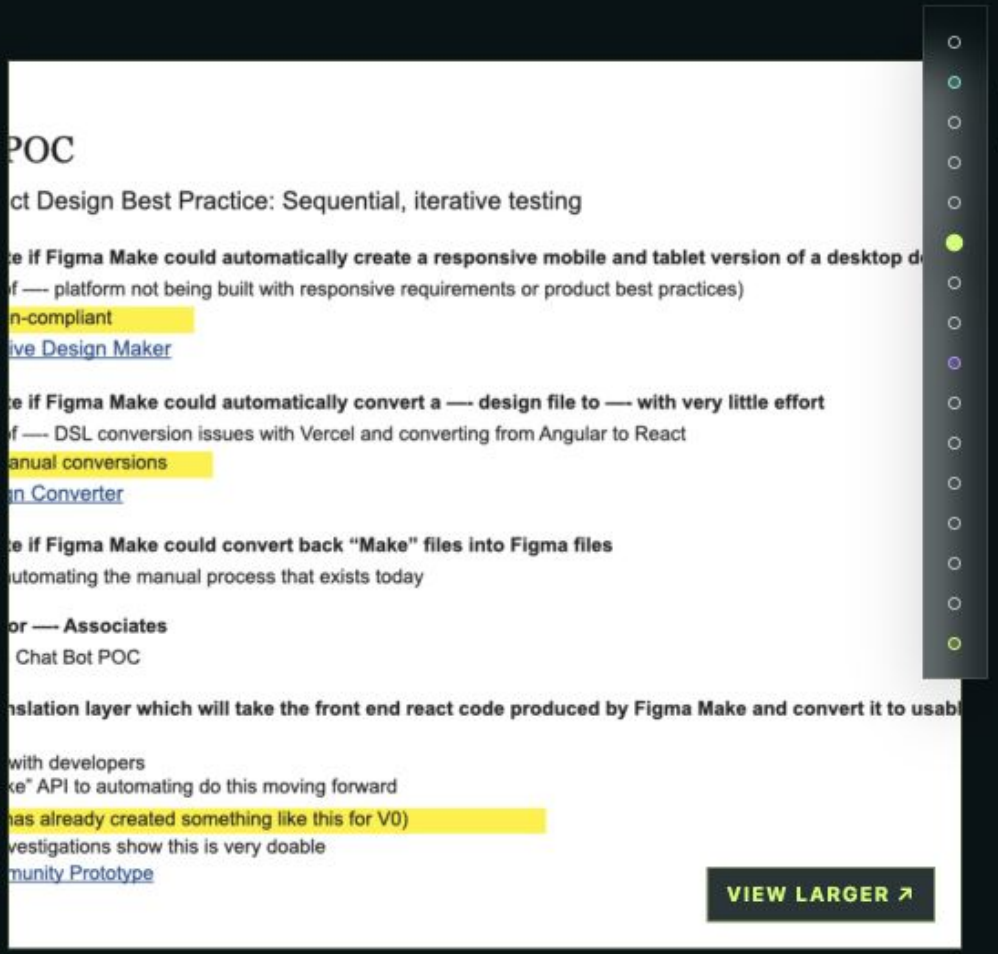

01.4

DATA-DRIVEN DECISIONS

Evaluate tools using real projects

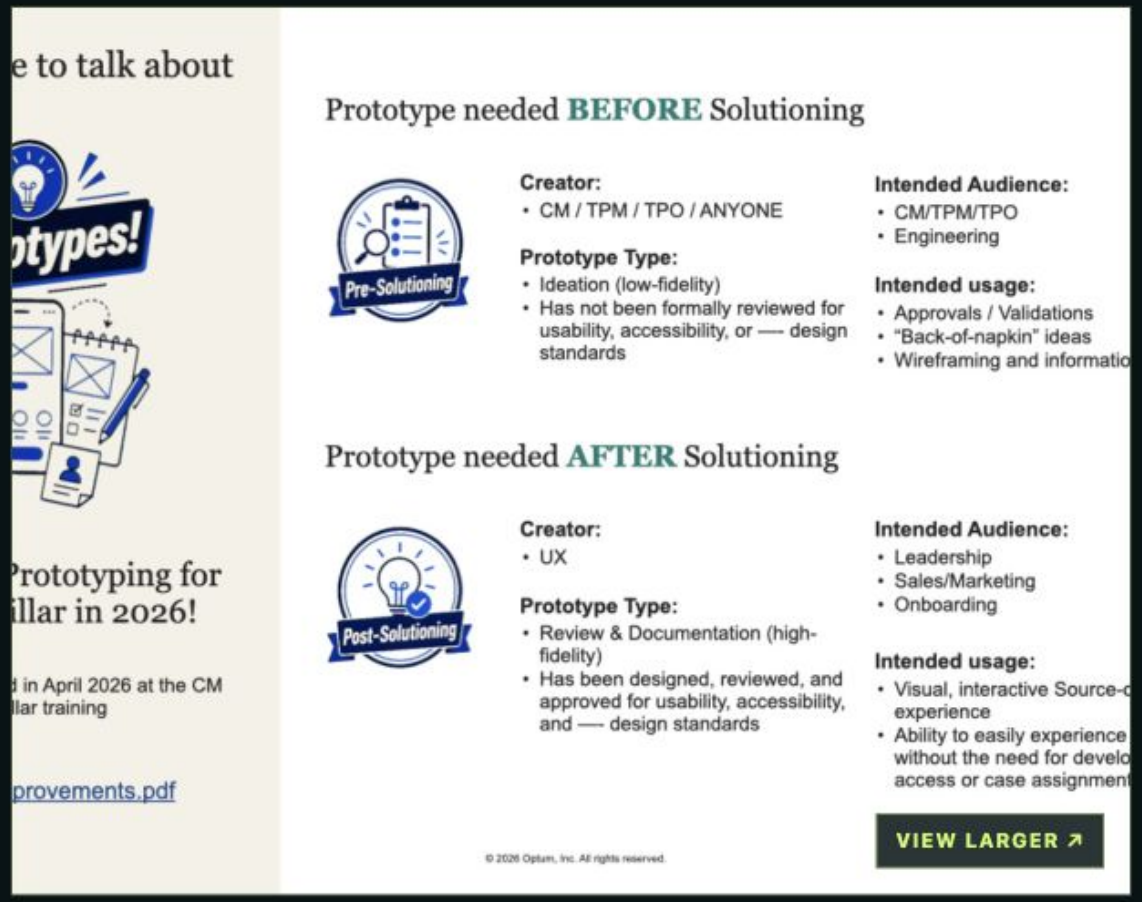

V0, Figma Make, Aha! Elle, Anthropic, ChatGPT, and Copilot Pro were assessed and tested using real-life design projects (during live build cycles), not demo conditions or theoretical examples.

Knowing the strengths and limits of generative AI, I was able to identify gaps in V0, including the lack of DSL management, atomic design level governance of design assets, and the lack of consistency from design to design.

Sequential method of testing product

01.5

IMPROVING OUTCOMES

Faster production with fewer avoidable loops

I improved consistency and innovation by demystifying the design process and showing teams where AI could add value without fragmenting the brand, bypassing design-system standards, or weakening human judgment.

I front-loaded prototyping and visualized low-fidelity concepts before requirements were finalized, helping the organization move beyond feature-factory behavior.

01.6

CONTINUAL CHANGE MANAGEMENT

AI as a force multiplier instead of a resource minimizer

By the beginning of 2026, I had authored company-wide Product Design management by objectives (MBOs), led technology and design-feasibility assessments, founded a TED-style internal AI forum, and embedded AI as a standard operating practice within the design process to accelerate responsible innovation.

I presented the new processes in technology and business forums and documented them in a Product AI SharePoint repository, Viva Engage site, and Loop Wiki to support communication and change

KEY TAKEAWAYS

Double Diamond in the real world

DISCOVER

Business outcome

Choose the workflow and define value, risk, and ownership.

DEFINE

Feasibility + fit

Test tools against genuine team needs and system constraints.

DESIGN

Guardrails + DSL

Encode brand, accessibility, components, and review expectations.

DELIVER

Enable + measure

Share patterns, automate repeatable work, and track impact.

TOPIC 02 / PRODUCT & USER EXPERIENCE INITIATIVE

02 | Transforming a healthcare ecosystem, end to end.

In 2017, as UX Director and Managing Consultant for a 501(c)(3) IT consulting firm, I helped sell and lead a $9M+ digital transformation for a $4.2B healthcare provider spanning 12+ websites, multiple properties and affiliates, and a custom intranet.

Working closely with executive leadership, I built and managed a hybrid workflow connecting client and internal teams across design, engineering, marketing, and product management. I also coordinated third-party vendors and stakeholders while helping optimize the client's product and engineering organizations.

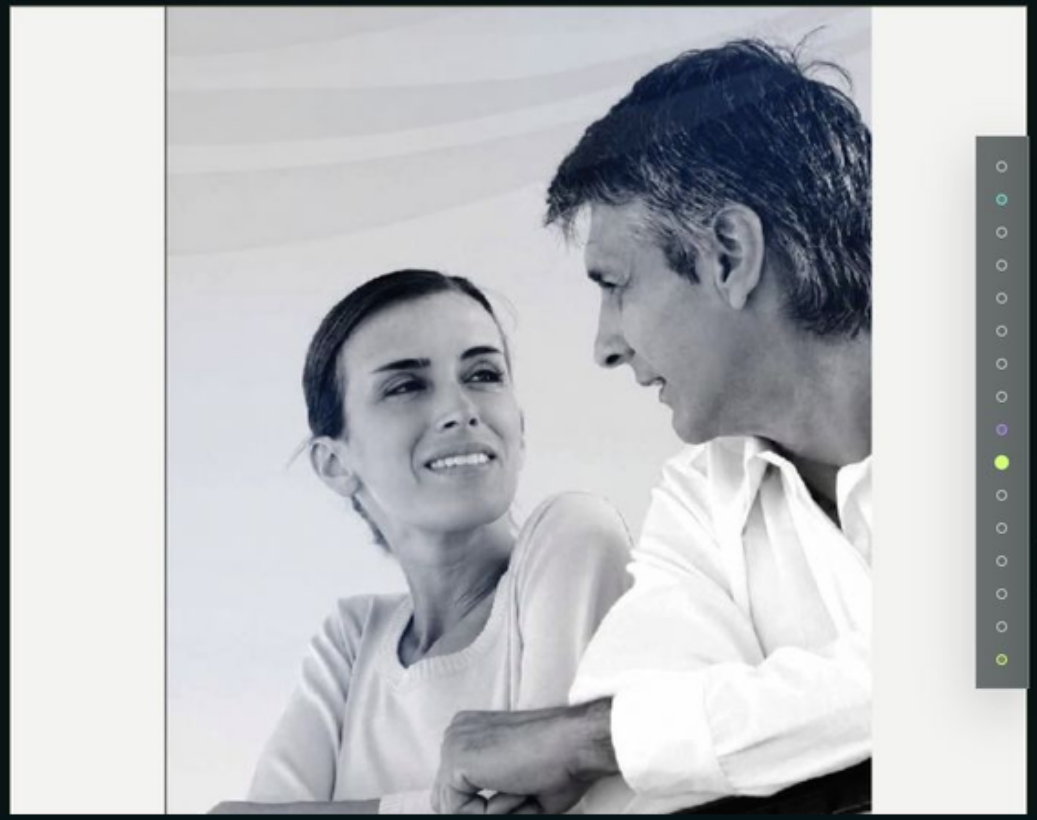

HEALTHCARE TRANSFORMATION PARTNER

$9M+
engagement

100+
sub-sites transformed

20K
web pages re-platformed

100+
user interviews and tests

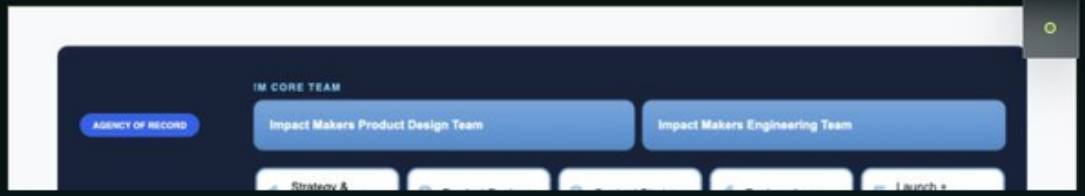

02.1

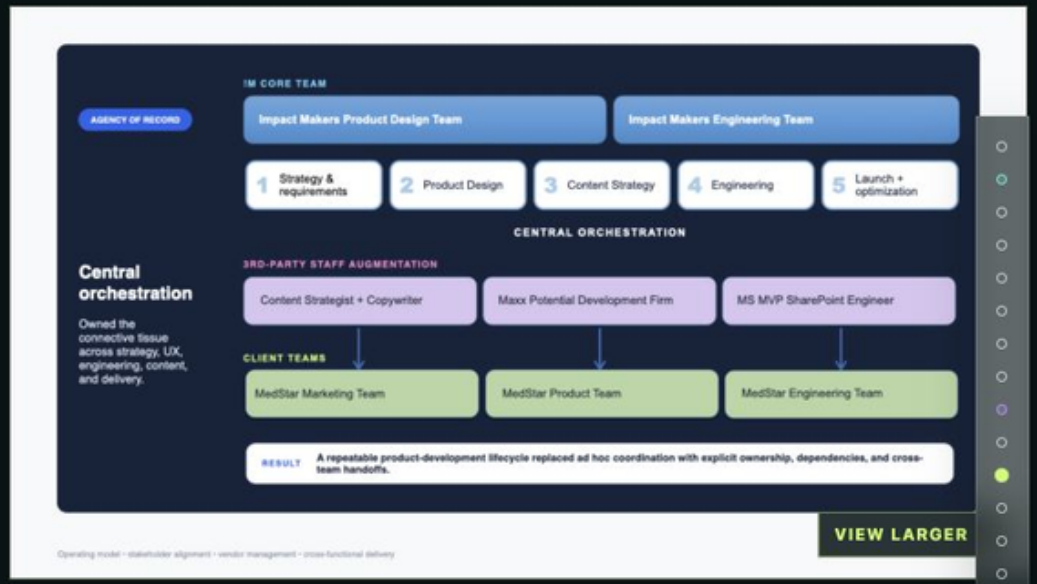

PROBLEM / OPPORTUNITY

A fragmented digital estate

More than 100 sub-sites, 20,000 pages, and 10+ hospital sites needed a coherent customer experience, scalable content model, and modern platform foundation.

The previous properties relied on proprietary CMS platforms which were not scalable. Subsequently, the client did not have staff capable of managing the new ecosystem.

Agency of Record SOP

02.2

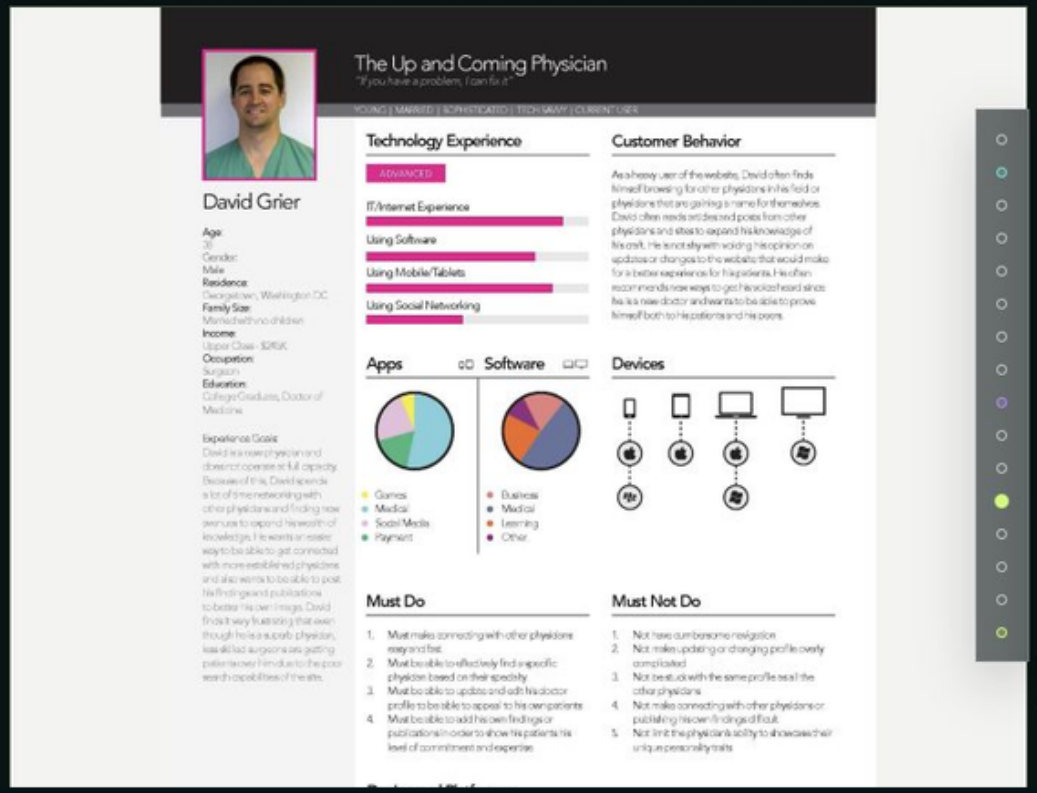

DISCOVERING THE POSSIBLE

Executive alignment through delivery

At each phase, the scope of new SOWs uncovered an organization who was ready for change but didn't know how to get there.

Discovering the client needed experts inserted into their organization at key stations to ensure successful organizational change management and skillful training to enforce adoption.

02.3

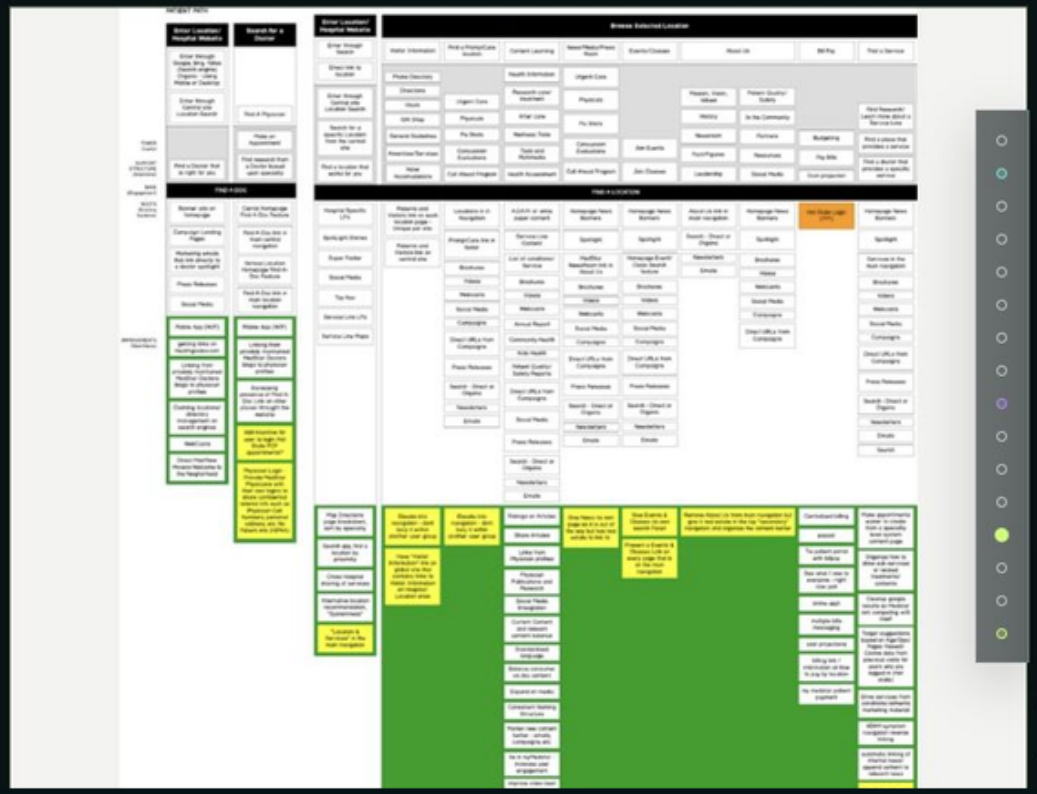

CUSTOMER INSIGHT + DATA

Ethnographic research in a practical setting.

I used personas, archetypes, mental models, cognitive walkthroughs, lab observation, focus groups, surveys, baseline studies, Treejack, card sorting, five-second tests, and time-on-task testing to shape decisions.

This research increased confidence in the MVP by validating it with participants representing every identified persona and archetype.

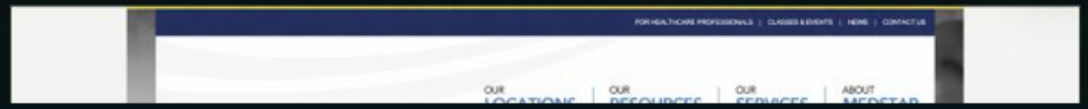

02.4

DESIGN SYSTEM

Consistency across a distributed ecosystem.

I created a Design System Language (DSL) based on Atomic Design principles, along with a client style guide and digital asset management solution. Every design accounted for responsive breakpoints and was documented through clickable InVision prototypes, Zeplin specifications, and high-fidelity Sketch files.

I used mental models and a taxonomy audit to shape a content strategy that included reviewing, rewriting, and establishing new workflows for long-term consistency.

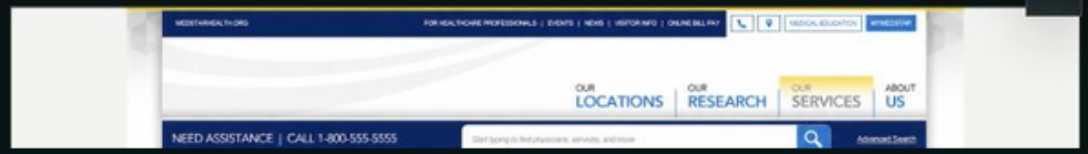

02.5

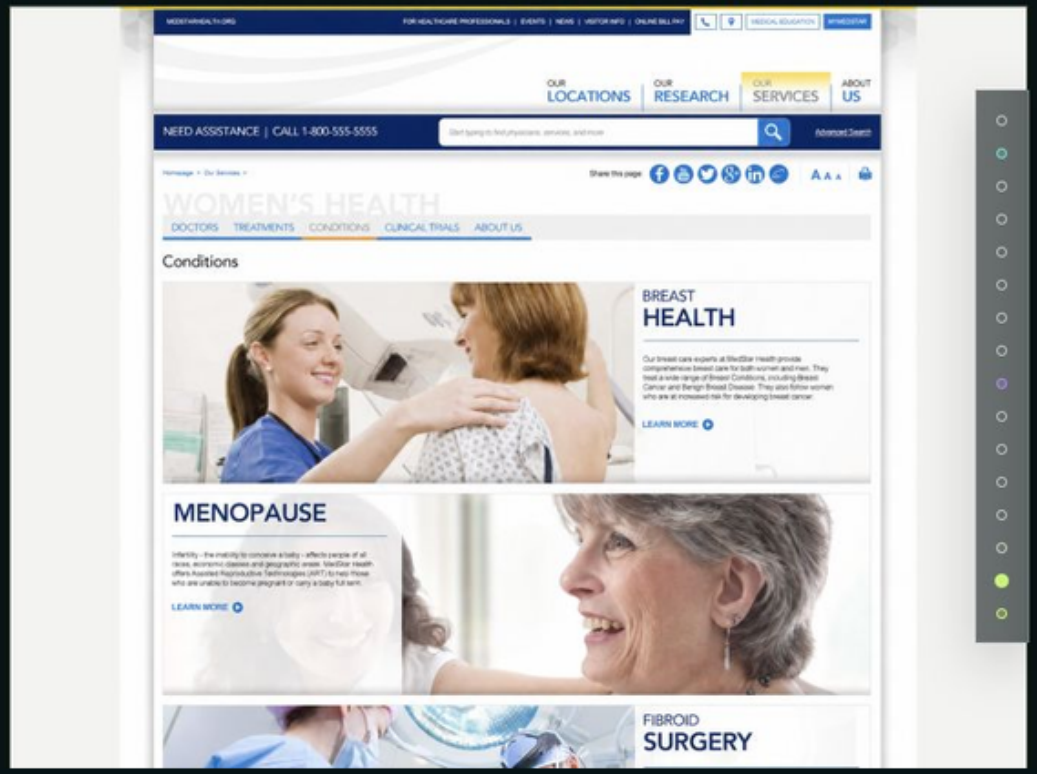

PRODUCT + ENGINEERING PARTNERSHIP

Build once, reuse many.

The experience strategy connected content migration, platform rework, prototyping, implementation constraints, and validation across internal and external development teams.

Homepage and L1 pages followed the same general template while allowing each property enough customization to feel unique within the parent brand strategy and its CMS-defined limitations. This enabled easier content creation and scalable reuse.

02.6

OUTCOME + LESSON

Simplifying the complex and defining MVP.

The transformation established a unified experience across a vast estate. At this scale, shared models and evidence create the flow that keeps executive intent connected to implementation.

Each L2 page used a flexible template that also supported specialty sites, allowing smaller, separately funded entities within the healthcare system to maintain distinctive microsites without breaking parent digital-platform standards.

KEY TAKEAWAYS

Double Diamond in the real world.

KEY TAKEAWAYS

Double Diamond in the real world.

DISCOVER

Ecosystem reality

Map properties, content, teams, customer needs, and platform constraints.

DEFINE

Shared experience model

Align taxonomy, governance, ownership, and measures of success.

DESIGN

Reusable system

Create flexible templates, design-system patterns, and content standards.

DELIVER

Govern + evolve

Coordinate teams, validate releases, and improve the ecosystem over time.
